-!- SUBUNIT ID DISTRIBE-LINKED DIMER OF A AND B CHAINS.
-!- DOMAIN: THE B CHAIN IS COMPOSED OF TWO DOMAINS, EACH DOMAIN
CONSISTS OF 3 HOMOLOGOUS SUBDOMAINS (ALPHA, BETA, GAMMA).
-!- SIMILARITY: IN THE N-TERMINAL SECTION, BELONGES TO THE RIBOSOME-
INACTIVATING PROTEIN FAMILY. TYPE 2 RIP SUBFAMILY.
-!- SIMILARITY: Contains 2 ricin B-type lectin domains.
                                                                                                                                                                                                                                                                                               -!- CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at

The complete amino acid sequences of the B-chains of abrin-a and abrin-b, toxic proteins from the seeds of Abrus precatorius.";

Biosci. Biotechnol. Biochem. 57:166-169(1993).

-!- FUNCTION: THE A CHAIN IS REPONSIBLE FOR INHIBITING PROTEIN SYNTHESIS THROUGH THE CATALYTIC INACTIVATION OF 60S RIBOSOMAL SHEIN-A IS MORE TOXIC THAN RICIN.

-!- FUNCTION: THE B CHAIN IS A GALACTOSE-SPECIFIC LECTIN THAT PACLILITATES THE BINDING OF ABRIN TO THE CELL MEMBRANE THAT PRECEDES ENDOCYTOSIS.

Bioconj. Chem. 5:423-429(1994).
-!- FUNCTION: RIBOSOME-121 ANCTIVATING PROTEIN OF TYPE 1, INHIBITS
-!- FUNCTION: RIBOSOME-IN ANIMAL CELLS (BY SIMILARITY).
-!- CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at or specific adenosine on the 28S rRNA.
-!- SIMILARITY: BELONGS TO THE RIBOSOME-INACTIVATING PROTEIN FAMILY.
TYPE 1 RIP SUBFAMILY.
                                                                                                                                                                                                                                                                                                                  Siegall C.B., Gawlak S.L., Marquardt H.;

                        PRECEDES ENDOCYTOSIS.

-!- CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one specific adenosine on the 28S TRNA.
-!- SUBUNIT: DISULFIDE-LINKED DIMER OF A AND B CHAINS.
-!- DOMAIN: THE B CHAIN IS COMPOSED OF TWO DOMAINS, EACH DOMAIN CONSISTS OF 3 HOMOLOGOUS SUBDOMAINS (ALPHA, BETA, GAMMA).
-!- SIMILARITY: IN THE N-TERMINAL SECTION; BELONGS TO THE RIBOSOME-
                                                                                                                                                                                                                         ABRA ABRRR STANDARD; PRT; 528 AA.

"Complete amino acid sequence of luffin-b, a ribosome-inactivating protein from sponge gourd (Luffa cylindrica) seeds.";

Agric. Biol. Chem. 55:229-338(1991).

-!- CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one specific adenosine on the 28S rRNA.

-!- SIMILARITY: BELONGS TO THE RIBOSOME-INACTIVATING PROTEIN FAMILY.

TYPE I RIP SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Luffa cylindrica (Smooth loofah) (Sponge gourd).

"Cloning and analysis of a cDNA coding a putative ribosome-
inactivating protein from Cucumis figarei.";
Plant Biotechnol. 17:337-340(2000).
-!- CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one
specific adenosine on the 28S rRNA.
-!- SIMILARITY: BELONGS TO THE RIBOSOME-INACTIVATING PROTEIN FAMILY.
TYPE 1 RIP SUBFAMILY.
                                                                                                                                 Eukaryota, Viridiplantae, Streptophyta; Embryophyta; Tracheophyta;

purification, characterization and mutagenesis of the A-Chain.";
Submitted (SEP-2000) to the EMBL/GenBank/DDBJ databases.
-! CATALYTIC ACTIVITY: ENDOHYDROLYSIS OF THE N-GLYCOSIDIC BOND AT ONE
SPECIFIC ADENOSINE ON THE 28S RRNA.
-!- SIMILARITY: BELONGS TO THE RIBOSOME-INACTIVATING PROTEIN FAMILY.
EMBL; AF259548; AAF68978.2; --

                                                                                                                                                                                                                                                                                     ----NRVGLPINQRFILV 47
                                                                The invention covers analogues of Type I RIPs. Ricin is a Type II RIPs whose A chain is howologous to plant type I RIPs. The analogues of the invention have a cysteine available for intermolecular disulphide bonding at an amino acid position corresp. to a position not naturally available for bonding; the cys residue is located in the C-terminal region of the analogue between a position corresp. to amino acid 251 and the C-terminus of ricin A chain. The analogues are pref. joined via a disulphide linkage to a molecule which specifically binds to a target cell, e.g. an antibody fragment.

                                                                                                                                                                AAR63902 is the ricin A chain gene product, it is analogous to the ribosome-inactivating proteins (RIPs) described in AAR6393-R63911. RIPs are the key components of cytchoxic therapeutic agents (CTAS), which include gene fusion products and immunoconjugates. CTAS may be used to selectively eliminate any cell type to which a RIP component is targetted, by the specific binding capacity of the second component of the agent. They can be used in the treatment of diseases where the elimination of a particular cell type is

The sequences given in AAW21698-710 represent Ribosome Inactivating
Proteins (RIP's), which may be used in the construction of the
Proteins (RIP's), which may be used in the construction of the
proteins of the invention. The proRIP has a selectively removable,
internal peptide linker. The precursor sequence is incapable of
inactivating eukaryotic ribosomes, but can be converted by removal
of the linker into a protein having alpha and beta fragments and being
clamble of inactivating eukaryotic ribosomes. RIPs are potent
inhibitors of eukaryotic protein synthesis. They possess a highly
specific N-94ycosidase activity which cleaves the glycosidic bond of
specific N-94ycosidase activity which cleaves the glycosidic bond of
cellular proliferation of cells, e.g. cancer cells and HIV-infected T
cells. The inactive prokIP proteins make it possible to provide protein
synthesis inhibitors with uses in practical and improved ways not before
possible. The RIP can be used to make cytotoxic conjugates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                48 ELSNHAELSVTLALDVTNAYVVGYRAGNSAYFFHPDNQEDAEAITHLFTDVQNRYTFAFG 107

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ਨੇ
                                                                                                                                                                                                                                                                                                                    AAW25136 represents a Ricin A-chain ribosome inhibitory protein (RIP)
which was engineered to contain a selectively removable internal peptide
linker sequence separating the alpha and beta units of the RIP. When
separated the two units regain activity and are capable of inactivating
cukaryotic ribosomes and hence preventing protein production. Many
different RIPS may be produced with an internal linker including
maize RIP, Trichosanthin, Ricin A-chain, Abrin-A A-chain and
Saporin. The RIPs can be used in the construction of therapeutic
toxins targeted to specific cells such as tumour cells via the
attachment of a targeting polypeptide, e.g. a monoclonal antibody.
A further use is in HIV therapy (see UG4869903). There is interest
in expressing RIP recombinantly in host eukaryotic cells, because of
the capacity to provide correct post-translational processing. However,
RIPS effectively inhibit protein synthesis in eukaryotic cells resulting
in cell death. Since the inactive RIP proteins are not cytotoxic to
cukaryotic cells, they can be recombinantly expressed in such cells and
then conversed to active RIP proteins.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       36 IFPKQYPIINFTTAGATVQSYTNFIRAVRGKLTTGADVRHEIPVLPNRVGLPINQRFILV 95
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The full-length sequences encoding ricin A (AAN70520), ricin D (AAN70525), putative ricin E (AAN70526) and RCA (AAN70524) in precursor form were obtd. using messenger RNA to obtain a cDNA library, and then probing the library to retrieve the desired cDNA inserts. The library was probed using the 35-mer given in AAN70514. Figure 4 (see AAN70520, AAN70521, AAN70522) shows the nucleotide sequences of three sequences contg. cDNA inserts obtd. by probing a cDNA library for sequences encoding ricin B using the probe in AAN70517. The cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          inserts can be placed into expression vectors. Site-directed mutagenesis may be used to place an ATG start codon and a HindIII site at the beginning of the mature protein (see AAN70518). The coding sequences of the inserts can be ligated into expression vectors contg. the PhoA promoter-operator and leader sequence (AAN70523) and suitable retroregulators.

The immunotoxin given in AAR70827 comprises the heavy and light chain variable regions of anti-lens epithelium IgG3 MAb 4197X linked to richin-A and a hexa-histidine trag. The DNA construct encoding the immunotoxin was expressed from pHB19 in E. coli. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Preproxicin is the whole polypeptide encoded by AAN50202 and the DNA encoding this is claimed. Proxicin is obtained from preproxicin by removal of the AA laader sequence. The linker AA sequence which is present in the precursor polypeptide is enzymatically removed in the cell to separate the A and B chains, which are joined by a disulphide bridge during the formation of the ricin molecule itself. This linker region as well as the presumptive amino terminal leader pur signal sequence are not present in the sequences already published by Funatsu et al.
                                                                                                                                                                                                                                                                                                                                                                                                                                             the A chain and chain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                or its

AAN90068) found on the EcoRI-HindIII fragment of DNA from Ricinu communis, Zanibariensis variety. Patent discloses many modifications of ricin in which the lectin binding function of the B chain is diminished or removed, and conjugation to toxins to eliminate cell binding. The sequence relates to preproricin protein encoded by the DNA sequence given in An16413. The invention relates to a novel toxin (e.g., ricin) based antiviral agent which is toxic to virus-infected cells, but non-toxic to uninfected cells. The invention has anti-HIV and virucide activities. Its mechanism of action is through inactivation of cellular ribosomes and enhancement of binding of the antiviral agent to galactose residues on cell surfaces, and its cellular internalisation. The invention is useful for treating human immunodeficiency virus infection and other viral infections, especially retroviral infections. The intiviral agent is activated in viral particles or early-stage infection and other viral infection and effectively preventing the integration of the viral genome into the host genome thereby preventing the integration of the viral genome into the host genome thereby preventing and not just cells known to act as host cells for the virus integrated in it, unless the cell is infected with the virus, where the viral protease activates it.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           107

```
The sequence relates to the amino acid sequence of a modified preproricin protein encoded by AAI64145. The invention relates to a novel toxin (e.g. ricin) based antiviral agent which is toxic to virus-infected cells, but non-toxic to uninfected cells. The invention has anti-HIV and virucide activities. The agent is able to enter all HIV susceptible cells, and not just cells known to act as host cells for the virus. The antiviral agent remains inert in a cell unless the cell is infected with the HIV virus, where the viral protease activates it. Ricin's mechanism of action is through inactivation of cellular ribosomes and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   enhancement of binding of the antiviral agent to galactose residues on cell surfaces, and its cellular internalisation. The invention is useful for treating human immunodeficiency virus infection and other viral infections, especially retroviral infections. The antiviral agent is activated in viral particles or early-stage infected cells, killing the cells upon infection and effectively preventing the integration of the viral genome into the host genome thereby preventing the latency/rebound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ----NRVGLPINORFILV 47

The full length sequences encoding ricin A (AAN70520), ricin D (AAN70525) putative ricin B (AAN70526) and RCA (AAN70524) in precursor form were obtained, using the messenger RNA to obtain a cDNA library, and then probing the library to retrieve the desired cDNA inserts. The library was probed using the 35-mer given in AAN70514. Figure 4 (see AAN70520, AAN70521, AAN70521, AAN70520, AAN70521, AAN70521, AAN70521, AAN70521, AAN70521, AAN70521, AAN70520, AAN70521, AAN70521, AAN70521, AAN70521, AAN70521, AAN70521, AAN70521, AAN70521, AAN70521, AAN70521, AAN70521, AAN70521, AAN70521, AAN70521, AAN705231, AAN705231, AAN705231, AAN705231, AAN705231, AAN705231, AAN705231, AAN705231, AAN705231, AAN705231, AAN705231, AAN705231, CORIECT PA FIELD.

DNA (see AAT91638) encoding the enzymatic A domain and a portion
of the A-to-B linker peptide of ricin was used to construct a
ricin-diphtheria toxin B'-interleukin-2 gene that was expressed in
E. coli. The hybrid protein can be isolated and used to treat
conditions involving over-production of cells bearing IL2 receptors,
such as certain T-cell lymphomes ribosomes in calls bearing IL2 receptors,
crises. The hybrid inactivates ribosomes in calls bearing IL2
receptors, resulting in cessation of protein synthesis and death of
tearget cells. Claimed hybrid proteins comprise a translocation
domain and a cell binding domain from e.g. a hormone, growth factor
or polypeptide toxin. The hybrid molecules can be used for the
                                                                                                                                                                                                                                                                                                                                                                               Ricin, cytotoxin, hybrid protein; cell delivery; cell binding ligand; translocation domain; diphtheria toxin B'; interleukin-2; T-cell lymphoma; organ rejection; therapy.

                                                                                                                                                                                                                                                                                                                                                     13; Gaps
delivery of agents (e.g. therapeutic genes, toxins, detectable labels) into cells. The use of a translocation mechanism ensures that the hybrid will be effective in relatively low doses, since a high proportion of the substance of interest will be taken into the targeted cells. The hybrid molecules can be manufactured as a single hybrid recombinant protein, permitting reproducibility, consistency, and the precise control of composition.                                                                                                                                                                                                                                                                                                                       Local
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RESULT 15
```

Example 4; Fig 11; 31pp; English.

The invention relates to a recombinant DNA molecule encoding a hybrid protein comprising three parts: (a) the first part comprises a portion of the binding domain of a cell-binding polypeptide ligand allowing the hybrid protein to bind to an animal cell; (b) the second part comprises a portion of a translocation domain of a naturally occurring protein coxin, british, botulinum neutoxin, ricin, cholera coxin, which translocate the third part of the across the cytoplasmic communication to the cytosol of the cell; which is non-native coxin, which translocate the third part of the across the cytoplasmic membrane into the cytosol of the cell; which is non-native communication of appropriate entity to be introduced into the cell, which is non-native captor bean ricin toxin sequence for use in generating the hybrid of the cinvention. The hybrid molecule enables the direction of appropriate corrupt cells, allowing them to function properly and alleviate or cure the disease. The hybrid is especially used in treating genetic deficiency diseases, by delivering to affected cells an enzyme cor soarce precursor or coffector, odirecting to a particular enzyme or a scarce precursor or coffector, coincer cell, or virus infected-cells), to counteracting viral infections such as correct precursor or viral proteins. It is also involved in the process of getting non-therapettic substances such as
